                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         CK
The present sequence is the murine chisel protein (Cs1), that is a CK member of the EF-Hand protein super family and is involved in signalling Cpathways. Csl protein is localised to the nucleus and does not show Ck significant homology to any known protein. Structural homology between CC csl and scallop regulatory myosin light chain is however detected. It is predominantly expressed in heart and skeletal muscles and is activated Ck after the differentiation of cells. Csl functions in regulation aspects of differentiation or adaptive processes that maintain muscle Cc of differentiation or adaptive processes that maintain muscle components. This sequence can be used in the detection, diagnosis, Ck prophylactic and therapeutic treatment of diseases such as those Ck involving aberrant muscle cell development and functional activity. It is also used in the treatment of muscular and myotonic dystrophies, component such as Duchenne muscular dystrophy, and Becker's myotonic dystrophy, heart failure, cardiac hypertrophy, myocarditis, cm myofiber atrophy, etc. The Csl gene sequence can also be used in gene therapy, for the production of transgenic animals and for drug screening.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Matches

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present sequence is the human chisel protein (Cs1), that is a member of the EF-Hand protein super family and is involved in signalling pathways. Cs1 protein is localised to the nucleus and has 86% homology to the mouse Cs1. Structural homology between Cs1 and scallop regulatory myosin light chain is also detected. It is predominantly expressed in heart and skeletal muscles and is activated after the differentiation of cells. Cs1 functions in regulation aspects of differentiation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 cells. Csl functions in regulation aspects of differentiation or adaptive processes that maintain muscle homeostasis. This sequence can be used in the detection, diagnosis, purplicatic and therapeutic treatment of diseases such as those involving aberrant muscle cell development and functional activity. It is also used in the treatment of muscular and myotonic dystrophies, skeletal myopathies such as Duchenne muscular dystrophy, myocardities, myofiber atrophy, heart failure, cardiac hypertrophy, myocardities, myofiber atrophy, etc. The Csl gene sequence can also be used in gene therapy, for the production of transgenic animals and for drug screening.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The patent discloses novel target genes abnormally expressed in heart tissues and their corresponding proteins. The invention also relates to methods for assessing the expression level of these genes. The method is used for testing the predisposition of mammals and preferably humans for a heart disease or for an acute state of such a disease. It is also useful to treat disease of the heart such as congestive heart failure, dilative cardiomyopathy, hypertrophic cardiomyopathy, ischaemic cardiomyopathy, specific heart muscle disease, rhythm and conduction disorders, syncope and sudden death, coronary heart disease, systemic arterial hypertension, pulmonary hypertension, pulmonary heart disease, valvular heart disease, congenital heart disease, pericardial disease and endocarditis. Sequences of the invention are also used in gene therapy. A transgenic non-human mammal comprising the sequences of the invention are useful for the development for medicament for the treatments of the stream of the stre

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present sequence is the xenopus chisel protein (CS1), that is a CC member of the EF-Hand protein super family and is involved in signalling pathways. CS1 protein is localised to the nucleus and does not show CC significant homology to any known protein. Structural homology between CC G1 and scallop regulatory myosin light chain is however detected. It is predominantly expressed in heart and skeletal muscles and is activated after the differentiation of cells. CG1 functions in regulation aspects CC of differentiation or adaptive processes that maintain muscle cc homeostasis. This sequence can be used in the detection, diagnosis, prophylactic and therapeutic treatment of diseases such as those CC involving aberrant muscle cell development and functional activity. It is also used in the treatment of muscular and myotonic dystrophies, cC skeletal myopathies such as Duchenne muscular dystrophy, and Becker's myofiber atrophy, etc. The CB1 gene sequence can also be used in gene cc therapy, for the production of transgenic animals and for drug screening.

                                                                                                                                                                                                                                                                                                                                                                                                                                                         ş
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to novel human secreted polypeptides. The polypeptides and antibodies to the polypeptides are useful for determining the presence of or predisposition to a disease associated with altered levels of polypeptide. The polypeptides are also useful for identifying agents (agonists and antagonists) that bind to them. Cells expressing the proteins are useful for identifying a therepolypeptide to aberrant expression or physiological interactions of the polypeptide. Vectors comprising the nucleic acids encoding the polypeptides and cells genetically engineered to express them are also useful for producing the proteins. The proteins are used as nutritional supplements. They may be used to increase stem cell proliferation; to regulate haematopoiesis; and in bone, cartilage, tendon and/or nerve tissue growth or regeneration; in treatment of leukaemias. AAU29510-AAU33304 represent the amino acid sequences of novel human secreted proteins of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Matches

These were derived from expressed sequence to from the organism of interest. They can be used in diagnostics, forensics, gene mapping, identification of mutations, to assess biodiversity and for nutritional purposes. The present sequence protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention provides the protein and coding sequences of novel proteins from a variety of organisms, including human, dog, cat, horse, cow, pig, hamster, monkey, macaque, yeast, bacteria, fruit fly, sea

                                                                                                                                                                                                                                                                                                                                                                                                                            The sequence given is a full length translation from the megakaryocyte continuating factor (MSF) precursor. The sequence covered by exons II, II and IV encodes megakaryocyte stimulating factor (MSF). This continuating factor (MSF) the sequence covered by exons II, II and IV encodes megakaryocyte stimulating factor (MSF). This continuating coden following exon IV. The cDNA sequence given contains content of the reminating coden following exon IV. The cDNA sequence given contains content of the reminating factor (meg-CSF). Exon I contains the initiating methionine, and encodes a collapsical mammalian protein secretion signal sequence. The sequence concoding the original meg-CSF includes exons II-IV and is thought to contain the region between amino acid residues 134 - 147. The content of this gene may be cleaved in different ways to yield a family of mRNA's each encoding a different MSF protein. Exons contains the thought to be related to the activity of the factor and a realso implicated in the stability, folding and processing of the synergy of MSF with other cytokines. Exons v - XII are believed to be implicated in the processing or folding of the appropriate structure of the resulting factor, ie. one or more of these exons may contain sequences which direct proteolytic cleavage, adhesion, organisation of the cellular matrix or extracellular matrix processing. Both naturally cocuring and non-naturally occuring MSF's may be characterised by with the exons spliced together in differing orders to form different extra members of them MSF family.

                                                                                                                                                            CC The invention relates to a method of treating osteoarthritis via the Cadministration of a composition comprising the camptodactyly-arthropathy-CC coxa vara-pericarditis (CACP) protein, or portions of the CACP protein. The composition may further comprise a local anaesthetic. The composition of the invention may be administered via intra-articular or intravenous confidence in the invention as the call management of the call management of the call management of the call management of the patients have symovial concerns a symovium lubricant, and can be used to lubricate tissue and call to reduce the symptoms of osteoarthritis. The composition may be capiled to reduce the symptoms of osteoarthritis (e.g., joint pain, concerns human megakaryocyte stimulating factor (MSF) cace, for protein). Where seems buman megakaryocyte simulating factor (MSF) cace protein). Where seems buman megakaryocyte simulating factor (MSF) cace protein). Where the sequence is not given in its entirety in figure 4 of the specification, although a GenBank accession number was given. This sequence obtained from GenBank (U70316).

                                                                                                                                                                                                                                                                                                         RESULT 10
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to a human tribonectin which is a product of CC alternative splicing of the human MSF (megakaryocyte stimulating factor) gene. The tribonectin has at least one O-linked oligosaccharide CC lubricating molety and has a polypeptide sequence comprising 1-76 crepeats of a motif having at least 50% identity to the sequence KEPAPTT CC (AAB29774). The invention also relates to a nucleic acid encoding a human MSF-derived tribonectin; a biocompatible composition comprising a CC human tribonectin for inhibiting tissue adhesion formation; and a method CC of diagnosing osteoarthritis or a predisposition to osteoarthritis by CC measuring the amount of MSF or its fragment in a biological sample of a mammal, wherein an increased amount of MSF compared to a control CC indicates the presence of or predisposition to developing osteoarthritis. The tribonectin and DNA encoding it are useful in the CC treatment of osteoarthritis, where they may be used for lubricating CC mammalian joints, such as articulating joints of humans, dogs or horses. CC The tribonectin, when formulated as a membrane, foam, gel or fibre, is cusful for inhibiting adhesion between two surfaces such as the injured CC tissues of a mammal, where the injury is caused by a surgical insertion CC tribonectin may be used in gene therapy. The present sequence represents for human MSF.
                                                                                                                                                                                                                                                                                                                                                                                                                                    Matches

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Conjugations and antibodies to the polypeptides are useful for the presence of or predisposition to a disease associated with altered levels of polypeptide. The polypeptides are also useful for cidentifying agents (agonists and antagonists) that bind to them. Cells expressing the proteins are useful for identifying a therapeutic agent for use in treatment of a pathology related to aberrant expression or physiological interactions of the polypeptide. Vectors comprising the nucleic acids encoding the polypeptides and cells genetically conjuneered to express them are also useful for producing the proteins. Conjuneered to express them are also useful for producing the proteins. Conjuneered to express them are also useful for producing the proteins. Conjuneered to express them are also useful for producing the proteins. Conjuneered to express them are also useful for producing the proteins. Conjuneered to express them are also useful for producing the proteins. Conjuneered to express them are also useful for producing the proteins. Conjuneered to express them are also useful for producing the proteins. Conjuneered to express them are also useful for producing the proteins. Conjuneered to express them are also useful for producing the proteins. Conjuneered to express them are also useful for producing the proteins. Conjuneered to express them are also useful for producing the proteins. Conjuneered to express them are also useful for producing the proteins. Conjuneered to express them are also useful for producing the proteins. Conjuneered to express them are also useful for producing the proteins. Conjuneered to express and in the proteins of the proteins and in treatment of leukaemias. AAU29510-AAU33304 represent the amino acid conjuneered to the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invent useful in developmental biology and in elucidating cell signalling cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL016176-ABL30511), expressed DNA sequences (ABL016176-ABL30511).

                                                                                       cytokine, cell proliferation or cell differentiation or which may induce production of other cytokines in other cell populations. The polynucleotides and polypeptides are useful in gene therapy, vaccines competite therapy. The polypeptides have various cytokine-like activities e.g. stem cell growth factor activity, haematopolesis regulating activity, tissue growth factor activity, immunomodulatory activity and activity instructions and/or activiny/inhibin activity and may be useful in the diagnosis and/or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    suitable search parameters, where plant sequences having an greater by a factor of 3 than the Evalue of most similar no sequences are selected. The polypeptides or nucleic acids er are "useful for identifying modulators. The identified modulators are the sequence are perfectly in the sequence are sequenced.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   28-FEB-2000; 2000US-0515126.

CC polymerase chain reaction (PCR) primers, oligomers, and for chromosome CC and gene mapping, and in recombinant production of (II). The CC polymucleotides are also used in diagnostics as expressed sequence tags CC for identifying expressed genes. (I) is useful in gene therapy techniques CC for identifying expressed genes. (I) is useful in gene therapy techniques CC (II), (II) is useful in gene therapy techniques CC (II), (II) is useful in gene therapy techniques CC (II), (II) is useful for generating antibodies against it, detecting or CC quantitating a polypeptide in tissue, as molecular weight markers and as CC a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating CC disorders involving aberrant protein expression or biological activity. (If polypeptide and polymucleotide sequences have applications in CC diagnostics, forensics, gene mapping, identification of mutations CC responsible for genetic disorders or other traits to assess biodiversity amino acid sequences. ABG00010-ABG30377 represent novel human CC amino acid sequences of data and products dependent on DNA and CC amino acid sequences of the invention.

CC Note: The sequence data for this patent did not appear in the printed CC specification, but was obtained in electronic format directly from WIPO CC at ftp.wipo.int/pub/published_pct_sequences.

UI-E-DXO is a cDNA library containing the following tissue(s): fetal eyes. The library was constructed according to Bonaldo, Lennon and Soares, Genome Research, 6:791-806, 1996. First strand cDNA synthesis was primed with an oligo-dT primer containing a Not I site. Double stranded cDNA was ligated to an EcoR I adaptor, digested with Not I, and cloned directionally into pT7T3-Pac vector. The oligonucleoride used to prime the synthesis of first-strand cDNA contains a library tag sequence that is located between the Not I site and the (dT)18 tail. The sequence tag for the program, Gene Discovery in the Visual System, supported by National Eye Institute (NEI)."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Location/Qualifiers

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           836.

UI-B-DX0 is a cDNA library containing the following tissue(s): fetal eyes. The library was constructed according to Bonaldo, Lennon and Soares, Genome Research, 6:791-806, 1996. First strand cDNA synthesis was primed with an oligo-dT primer containing a Not I site. Double stranded cDNA was ligated to an EcoR I adaptor, digested with Not I, and cloned directionally into pT7T3-Pac vector. The oligonucleotide used to prime the synthesis of first-strand cDNA contains a library tag sequence that is located between the Not I site and the (dT)18 tail. The sequence tag for this library is AGANTCAAGA. This library was created for the program, Gene Discovery in the Visual System, supported by National Eye Institute (NEI)."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Conservative
